Ail the sequence with length 100 codons or more between ATG or GTG and stop codon are defined as CDS.
Accology analysis is performed by Smith Waterman algorithm against GenBank and Genept release 109; EMBL release 56.0; Swissprot release 36.0; PIR-Protein release 57.0; and OWL release 31.0.

During 1995 to 1996 about 668 of S. pombe chromosome 1 was
During 1995 to 1996 about 668 of S. pombe chromosome 1 was
sequenced by the Sanger Centre. The Sequencing of the S. pombe
genome is now being costinued with funding from the European
Commission. Fourteen European sequencing laboratorics, including
the Sanger Centre, are participathing in the project.
Protein coding regions (DS) have been predicted with the help of
computer analysis using the Genefinder program in Pombase (an ACEDE
database) with additional predictions for the branch-acceptor sites
supplied by the program SpSaplice. To the branch-acceptor sites
supplied by the program SpSaplice. To the branch-acceptor sites
any individual CDS we may have underestimated or overestimated the
number of introns/exons or we may not have chosen the correct
splice donor/acceptor sites.
Complementary strand.
In more significant matches with motifs in the PROSITE database
The length in codons is given for each (CDS.,
The length in sequence MAY NOT be the unlike insert of the
sequenced clone. It may be shorter because we only sequence

It may be shorter because we only sequence overlapping sections once, or lorger, because we arrange for small overlap between neighbouring submissions.

                                                                                                                                                        This DNA sequence encodes a R-specific amidohydrolase isolated from Xlebsiella cxytoca strain PRS1 which allows the microorganism to utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AGGTGATGTGCTCGCTGTCTATATCGAATCCATGTTGCCCCGCGGCGTTGATCCCTACGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            741 TGACCCCAGACAATCACGCGGGGAATAIGGATGTGCCGGATATAGGACCAGGGAGTATTA 800
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           861 AGGGTGATGGTGAGATTTGCGGGACCGCAGTAGAGTTTGCCTCAATCACCACCATCAAAG 920
                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel amidase, and the gene encoding the novel amidase, from Enterobacter cloacae. The novel amidase stereoselectively hydrolyses alpha-amino acid amides and alpha-hydroxy acid amides to give optically active alpha-amino acids and alpha-hydroxy acids. The invention also relates to variants of the novel amidase which retain activity, recombinant vectors and host cells containing the novel amidase gene taken activity and more amidase. Genetically manipulated microorganisms comprising the novel amidase gene have remarkably elevated catalytic capability as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        compared to those produced by conventional methods. The present sequence represents DNA encoding the novel Enterobacter cloacae amidase.
                                                                                                                                                                                                                                                                                         Novel amidase gene encoding protein which stereoselectively hydrolyzes alpha-amino-acid amides and alpha-hydroxy-acid amides, with enhanced catalytic capability to yield optically active alpha-amino-acids and alpha-hydroxy-acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CCTAICTGCCGGTACGTGCGCCTGGAGGCGCGCGTGTTATTGGTGATGCCTTGTC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      552
                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel amidase, and the gene encoding the novel amidase. From Enterobacter cloacae. The novel amidase stepulation of the novel amidase distributely hydrolyses alphalamino acid amidas and alpha-hydroxy acid amides to give optically active alpha-amino acids and alpha-hydroxy acids. The invention also relates to variants of the novel amidase which retain activity, recombinant vectors and host coils containing the novel amidase gene, and recombinant production of the novel amidase gene have remarkably elevated catalytic capability as compared to those produced by conventional methods. The prosect sequence represents the DNA coding sequence of the novel Enterobacter cloacae.
                                                                                                                                                                                                                                                                  Novel amidase gene encoding protein which sterepselectively hydrolyges alpha-amino-acid amides and alpha-hydroxy-acid amides, with enhanced catalytic capability to yield optically active alpha-amino-acids and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ::
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the genomic sequence of Pyrococcus abyssi and P. abyssi proteins (see AAB96053-AAB96842). P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is a fragment of the genomic sequence of P. abyssi. The 5' end of this sequence overlaps with the 3' end of AAH41223 and the 3' end of this sequence overlaps with the 5' end of AAH41223 proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     743 ACGCCAGACAATCACGGCGGGAATAIGGATGTGCCGGATATAGGACCAGGGAGTATTACC 802

Cell death genes, or antisense sequences, can be used to reduce or abolish apoptosis, e.g. in transgenic animals. An hid cDNA sequence is given in AAQ66950, and the deduced sequence of the encoded HID protein in AAR55791.
                                                                                                                                                                                                                                                                                                                                   Solated cell death genes from Drosophila - and novel assays for apoptotic cell deaths and apoptotic and necrotic cell deaths, based on selective staining by toluidine blue, acridine orange and Nile blue

                                                                                                                                                                                                                                                                                                                                                                                     specification, but was obtained in electronic format directly from WIPC at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                    genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                           The invention relates to an isolated mucleic acid detection reagent capable of detecting 1000 or more genes from Tycsophila. The invention useful in developmental biology and in elucidating cell signalling and call-cell interactions in higher cukaryotes for the development of inscetticides, thorapeutics and pharmaceutical frugs. The invention discloses genomic DNA sequences (ABLD1676 ABL3551), expressed DNA sequences (ABLD1840-ABL16175) and the encoded proteins
                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              440 AAUCCACAAAACGGACCGATCATGGTCAATGGCGCGGGAGAAGGTGATGTGCTCGCTGTC 499
                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention usert, in developmental biology and in elucidaring cell signalling and cell cell circlel interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL30511), and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
New isolated nucleic acid detection reagent for detecting 1000 or more quees from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neisseria meningitidis; Neisseria gonorrheae; genome; immumogenic;

                                                                                                                                                                                                                                                                                                                                                                Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions.

The present invention describes the full length genome of
Neisseria meningitidis B (NMB). The sequences in AAP21544 and AAF21607
C Neisseria meningitidis B (NMB). The sequences in AAP21544 and AAF21607
c to AAP21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into B sequences which overiap each other at the beginning and end of each sequence by 49800 bp (i.e. the last 49980 bp of AAF2164 is repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21607 are repeated at the beginning of AAF21608, and so on). AAF21545 to AAF2168 encode the Noisseria proteins given in AAB38550 to AAB28593, and AAF2158 encode the Noisseria proteins given in AAB38550 to AAB28593, and AAF2158 to the present invention. The NMB genome and fragments from it have antipacterial activity, and can be used in vaccines and gene therapy.

Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection of the Neisserial bacteria or of antibodies which binds to the proteins conputers. Computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide turther opportunities to find antipodies immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         276041 AGCGAAGCATTATTTGAAGACATCGAAGACCAAATCGACAAAAGGGGTGGGATTTCGAC 276100

The present invention describes methods of obtaining immunisciic proteins from Neisseria genomic sequences. AAA81451 squence: 0.NA represent specifically claimed Neisseria monimitidis squence: 0.NA sequences. AAA81250 to AAA81363 to AAA81360 to AAA81560 to AAA81560 to AAA81560 to AAA81560 to AAA81560 to AAA81560 to Cresponding proteins. AAA81254 to AAA81259 and AAA81361 represent Pork primers used in the collection of Neisseria meningitidis bNA sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis Menb polyncolectide ORF sequences, which are all used in the exemplification of the present of any analysis of a composition. The composition can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition of treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all assorbypes; and/or against all pathogenic Neisserial of form the manufacture of a components of vaccines against Meningococcus B; against all serotypes; cand/or against all pathogenic Neisserial of Delugical probes; confirm will also facilitate production of sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Scarlate V:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly organism specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolcrance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, compicte sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The reaper (rpt) and head involution defective (hid) genes, mapping to position 75C1.2 of D. melanogaster chromosome 3, exhibit coxpicssion patterns related to the pattern of cell death during broscophila embryogenesis. Cell death genes, or antisense sequences, can be used to reduce or abblish apoptosis, e.g. in transgenic animals. The genomic sequence of hid is given as 4 contiguous sequences in AAQ66946-49, which together encode HID protein.
